Name: ManageSalaryRaiseRequests
Participating actor(s): Developer (Initiator) IT Manager Financial Manager
Entry Conditions: 1. Developer logsins to the system. 2. System validates the developer credentials. 3. Developer accesses the create vacation request functionality This use case extends InvalidCredentials, PerformanceConflict, PriorityConflict, BudgetConflict and SuspendForFuture use cases. They are initiated when the login credentials are invalid, or when there is a conflict in the performance of the developer for the requested salary raise, or when there are other developers who requested raised salary in the same period and the developer has no priority, or when the application needs to be suspended for the future when the developer deserves a raise but the company does not have enough money.
Exit Condition: Financial Manager decides whether to approva or cancel the salary request
Quality Conditions: The system should be available and functioning without unexpected interruptions
Event Flow: 1. Developer chooses to create a new salary request application 2. System displays the requested form 3. Developer fills the application with the required salary, and reason for raise 4. Developer chooses to send the application to the IT manager 5. System displays the new request to the IT manager 6. IT manager reviews the application and chooses to review the developers performance and other developers priority of getting a raise. 7. System displays the performance of the developer as well as list of priority among developers 8. IT Manager chooses to approve or reject the application. If approved sent to the Financial Manager 9. Financial manager reviews the application and chooses to review the budget for the possibility of a raise. 10. System displays the budget and if the requested salary fits the budget 11. Financial Manager chooses to approve, reject or suspend the application. 12. System displays the result of the request to the initiator developer.
